

# Investment Machinery and Operator Credentials

## Investment in Machinery

In March 2006 Vital Earth bought a 3 hectares brown-field site on the edge of an industrial estate in Ashbourne following planning approval and the granting of the Waste Management License to process 85,000 tonnes of meat inclusive catering waste, the site was constructed and became fully operational by September 2006.

Our commitment to providing the most advanced in-vessel composting site in the UK is supported by the £10million investment made to date. We continually research opportunities that improve the processes that effectively combine nature and technology in order to produce a by-product, which has a significant environmental benefit.

## Operator Credentials

Vital Earth travelled and researched technologies worldwide during 1999. Ideas from different successful technologies were used to develop "The Vital Earth System" suitable for mainland Europe and the UK market.

The control system that regulates the airflows and temperature was also developed in house and the system as a whole has undergone continuous improvement since it's first implementation on a pilot scheme in 2001.

In short we offer Technical Expertise, Planning Experience and Proven Technology plus a desire to go beyond the exacting standards that the industry dictates.

This ensures that a decision to partner with us is risk free. We also pride ourselves on our flexibility, a small team of around 25 and a flat management structure, means we are able to offer a personalised service and react quickly to demands made upon us.
